1. Compressor
2. Air Tank
3. Water Separator
4. Compressed Air Filter (Pre-Filtering)
5. Air Dryer
6. Compressed Air Filter (General Purpose Protection)
7. Compressed Air Filter (Oil Retaining Filter)
8. Oxygen Generator
9. Oxygen Tank
10. Compressed Air Filter (Solid Particle Filtering)
11. Active Carbon Filter

Stage 1: The compressor absorbs and compresses the ambient air. Compressed air from 5 to 7.5 bar is required to produce oxygen. Compressed air from 6 to 10 bar is required to produce nitrogen. The air occupying 8 m³ volume at 1 atm pressure occupies 1 m³ volume at 8 atm pressure.

Stage 2: An Air Storage Tank is used immediately after the compressor. In this tank, pressurized air in enough volume capacity is stored. This stored air is called Generator Supply Air. Also, an Automatic drain valve is installed at the bottom side of this tank for evacuation the water occurred by condensate air.

Stage 3: The air leaving the air storage tank is filtered by a water separator and a Compressed Air Filter.

Stage 4: The air passing through the filter enters the Air Dryer to be dehumidified. The dew point of the air leaving the dryer reaches +3 C or -40 C / -70 C according to the characteristics of the air dryer used. To put it more simply, the moisture in the compressed air is removed by the air dryer.

Stage 5: The air leaving the dryer is filtered again by General Purpose and Oil Retaining Filters. Before entering the Oxygen Generator, particles in the supply air are removed.

Stage 6: Oxygen / Nitrogen Generator is used after the filters. Compressed air is separated by passing through the generator at this stage.

Stage 7: Gas decomposed at the Oxygen / Nitrogen Generator output; O₂ gas is sent from line to the Gas Storage Tank

Stage 8: The O₂ gas leaving the O₂ storage tank is filtered again. Before entering the Hospital Regulator Feeding Line, particles in output line cleaned by a Solid Particle Filter and Active Carbon Filter.

Compressor

The compressor is the component that collects the air needed by the Medical Oxygen Production, Storage and Control System in to the system.

Air Dryer

Air dryers are used in the system to separate the water vapor in the air. The related DEW points are 3°C for Refrigerant Dryer or -40°C for Dessicant Dryer.

Filter sets

They are components used to filter particles and oil vapor in the air. They are effective in holding dust and oil. Active Carbon Filter used to filter odor and oil. Water Separators are used to separate condensed liquid water and residues in compressed air and gases.

Air Tank

It is a pressurized vessel in which the air that has passed through the dryer and filters is accumulated (at 10 bar pressure) before being sent to the oxygen generator. These tanks are resistant up to 16 bar pressure.

PLC Screen

It is the section that allows the user to communicate with the device.

Electrical Connections

Oxygen Analyzer: It is the component that is used to measure the oxygen concentration in the medical gas and transfers this measurement value to the PLC system.

Closed Metal Box

In order to protect all internal pre-arranged equipment of O2 generator against to external environmental conditions and unexpected interventions by unauthorized persons, a locked closed front metal case is used

ELASTIC NET BANDAGE

It is a unique bandage that keeps all of pads firmly and stable over the surface of the body, without applying and adhesive tapes nor any sort of conventional band aids.

FEATURES:

- Setanet; Is produced in the form of a net, therefore causes no perspiration.
- Setanet; acquiring multi application positions, can be used all over the body, including wrinkling areas.
- Setanet; does not bind and exhibits no impact on the blood circulation. No skin irritation is experienced as it permits air contact to the skin because of its shape.
- Setanet; causes no perspiration over dressing areas furthermore, thanks to its elasticity, it provides facility for the nurse and the patient during dressing or similar interventions.
- Setanet; is also a unique instrument to avoid closure of incisions by the skin wrinkling especially when the fat patients are involved. At the same time, it is used to protect the incisions against transport harms.
- Setanet; serves as varix sock or as an elastic bandage.
- Setanet; is hypoallergenic.
- Setanet; can be sterilized. The liquids of the body, serum, water and similar do not affect it.
- Setanet; is produced by ISO 13485 Quality System Certificate and CE certificate.

SETANET; the most efficient bandage to wounds of all sort, produced, with highest quality concerns.

SPECIFIC CONSUMPTIONS

- Neuro Surgery
- Orthopedic Surgery
- Abdominal Surgery
- Post Operative
- Stabilisation of Colostomy Set
- Plastic and Reconstructive Surgery
- Breast and Thorax Surgery
- Cardiology; Stabilization of ECG Electrodes
- Pediatrics; Stabilization of IV catheters

FORM OF PACKAGING

Setanet is packed in 9 different consumption sizes. Length way of consumption are indicated on every packing.
